Exercise 1.1

Create an XML file that stores data for a library (You can create this manually, I am not asking you to create a program to do this).

The library has two catalogues (technical books, and for cookery books).

Each catalogue can contain a number of books (say 2 for the purpose of this exercise) .

Books will have an ISBN, title and author.

Upload your .xml file to your github repository called **data-representation-coursework** and copy your link here:
